

- Project Proposal
 - Revised research aims
 - We will: 1) analyze the relationship between vitamin D intake levels and gut microbiome (alpha, beta) diversity in MS patients; 2) identify taxa associated with various levels of vitamin D intake and MS severity; 3) identify the functional potential of MS patients taking vitamin D supplements; and 4) identify markers for multiple sclerosis and fit these markers to disease severity.
 -  Project Proposal
 - Background, purpose in progress
 - Still searching for primary literature
 - Sections needed:
 - Literature Review (refer to group assignment 1)
 - Experimental Aims and Rationale
 - Proposed Approach
 - Participation Report
 - References
- Scripts
 - Shell script is in the github
 - /scripts/shell.sh
 - Supplementary figures, .R files in progress
