

[10:03 AM Start]

The proposal has not been marked yet!

[10:05 AM]

Consider filtering out treated MS patients

- Check how EDSS is measured, what kind of ppl are unmedicated (check disease duration)
 - Medications likely won't have an impact on edss

filter for significance in differential abundance analysis

rarefaction sampling depth: 10378

- used for alpha and beta diversity

3 samples will be filtered out

Maybe cut out random forest for now

[10:17 AM]

Presentations are in 2 weeks!

- Try to put together a mock presentation for next week
 - background
 - methods (aims)
 - couple slides on results
 - couple slides on conclusion, future directions
- divide into 2 slides

Make sure we synthesize the biological explanation with background/future directions

- not just saying there is "significance"

[10:28 AM]

Create a demographics table

- looks at both treated and untreated groups

Can control for medication

- Wilcoxon -> linear model
- Make sure to rationalize controls in the manuscript

If we split treat/untreat

- Make sure to include both in manuscript

How to control for a variable

- filter out the variable
- Add the variable to the analysis
 - vitamin D or severity + treatment

Nelson will take PICRUSt
